ABSTRACT

E-Commerce is expanding rapidly, but its expansion is being curbed by apprehension about network security. Many businesses avoid e-commerce because their understanding of the complex security issues involved is limited.

Our poster uses a two pronged approach to explain network security. First it breaks down the security issues to the sub system levels. Secondly it uses everyday analogies relating to securing of the networks from attacks. The poster covers securing from breaches that could occur from both within as well as from outside viz: the larger wide area networks to which the businesses connect.
