

Capital Press - Order Entry, Job Tracking And Quotation

Haydn Cain
Ben Wilson
Dipan Patel
Project sponsor: Capital Press Ltd
Unitec
Auckland, NZ

Capital Press provides printing services for business cards, newsletters, brochures etc. As the company grows they are finding it increasingly difficult to manage their work and have become operationally too dependent on one or two people.

The project will address these issues by enabling Capital Press staff to better manage their quotations, orders, products and customers. The project software will track information as it flows through different parts of the organisation enabling Capital Press to improve management decision making by better recording and reporting on the work they do. The software also includes an updated website for Capital Press where customers can view previous orders, track current ones and place new order by selecting and modifying previous ones.

The software is a networked multi-user application written in Delphi. It exchanges data with a web application written in PHP on a MySQL database.

The application will completely replace the existing software used by Capital Press and will soon become a mission-critical application and enable them to provide a superior service to their customers.
