Abstract

The National Advisory Committee on Computing Qualifications introduced an external moderation process for its certificate and diploma programmes in 1994 and is still in operation today. The process is in essence a manual process with few changes having been made to it in the years since.

This poster presents some of the work that was done as part of a student's capstone project in their final semester in the Graduate Diploma in Information and Communication Technologies (Grad Dip ICT) programme at Christchurch Polytechnic Institute of Technology (CPIT) in 2008.

The poster includes reflection on:

- The methodology followed by the student
- The requirements for a web-enabled external moderation process
- The suitability of the project for a capstone project
- The potential to develop a fully working version of the application
